When the MG TriggerGate is mounted in a camcorder or digital camera where the standard manual shutter button is not used, it can be activated by a remote control or by the people holding it. Using MG TriggerGate VST, it's as easy to take a picture as pressing the shutter button. Simply "push" a button and you are taken to the camera's aperture, shutter speed, or shutter release. Using a remote control, the stand alone support for a digital camera is identical to the remote control of a VSt. You can use the main control (menu, ok, camera/recorder button) of a camcorder to operate your MG TriggerGate. Each step has its own function that is fully customizable. You can change the 'play sound' and 'stop sound' files. You can alter the trigger switch angle (to make it more or less sensitive or to create other kinds of trigger prerolls). The files can be exported as midi files and loaded into a sequencer to be played, and have added to your free creative power. You can also take advantage of the 'step a delay' feature to have a delay between each step. You can start the sequence from the gate itself (like a 'middle C'), and the sequence will trigger and stop when the button is released. Each step also has a 'stop mode' that once started will stop any other steps, and allow the user to play them back without resetting the sequence. The stop mode can also trigger a step by remote control (as a process of deduction...) You can configure it to trigger between steps, stopping a number of steps up or down, and have a choice between on/off of each step, or a stop at a certain point. By default, the gate is set up to run a 10 step sequence, so you can set it to one or more step (this can be helpful for the timing of your drum patterns...). The files can be exported as midi files and loaded into a sequencer to be played, and have added to your free creative power. mgTriggerGate Plugin Features: 16 adjustable steps per gate Variable delay between steps Variable duration for each step Optional remote control Sequence can be triggered from the gate itself Single or repeated trigger output Customizable stop sound and play sound Multiple trigger inputs MIDI sequencing and playing External Volume input for multiple volume settings Wav Files: Comprised of 16 drum step objects (23 files) Stopped into a sequence that loops (by default) No Midi Wav file is optimized with compression to make them smaller for 1 or 2 gig backups I have explained below my experience with the plug-in by setting one step for on and one step for off. Step 0 = On and trigger is toggled to off. Step 1 = Off and trigger is toggled to off. Step 2 = On and trigger is toggled to on. Step 3 =
