Isolation and comparison of mitochondrial DNA from human retinoblastoma and osteosarcoma. In situ hybridization has been used to map the location of mitochondrial DNA (mtDNA) in human retinoblastoma and osteosarcoma. Neoplastic and non-neoplastic cell types in these tissues have been separated and the distribution of mtDNA restriction fragments has been examined. A high level of mtDNA restriction fragment deletion is observed in the retinoblastoma tumor cells, suggesting that a specific deletion of mtDNA may be associated with retinoblastoma tumorigenesis. In contrast, the osteosarcoma cells contain low levels of mtDNA deletion and the mtDNA restriction profiles are similar to those from corresponding control cells.

Design and synthesis of mono- and disubstituted-1,3-aminoindane oxides: inhibitors of cell growth. A series of mono- and disubstituted-1,3-aminoindane oxides were synthesized and evaluated as potential tumor-selective cytotoxic agents. Several compounds were potent inhibitors of cell growth in vitro. Optimized compounds exhibited GI50 values ranging from 1 to 3 microM. Selectivity against HT-29 (colon adenocarcinoma), BNL-1 (rat hepatoma), and LOX (mouse lung fibroblastoma) was demonstrated. Certain compounds showed increased potency in HT-29 cells and decreased toxicity in normal fibroblast cells. Mitotic delay was the primary toxic effect. Structural characterization of one of these compounds (11b) was accomplished by nuclear magnetic resonance and MS.

Q: Why is it so hard to fill "the hard-to-fill" posts? I've been googling it, searching SO's meta, my bookmarks and company's work email address. But I still can't figure out why is it so hard to fill "the hard-to-fill" posts? Any clues? A: Because, most of the time, there simply is not enough information available to do so. It's not hard to come by Stack Overflow posts that do not have an answer that's a real, useful answer. In particular: Unfortunately, some posts simply do not have enough information available to "answer" them. That's just the way the world is. If the question simply lacks an actual question, sometimes the

Q: Python Exception Handling code is not working I'm working on a project and it has a lot of python code. Everything was working fine until I have inserted a exception handler to avoid some problems, like null pointer access, division by zero etc. In my project I have several exception and the scenario is a bit complicated so I tried to avoid writing the whole try/catch block or a catch-all for all possible exceptions. So I'm handling it like the following. In my program I use a few exceptions such as if an exception is raised: raise exc_class(exc_msg, exc_hdl) else: print "error" The exception handler looks like this: def exc_hdl(exc_class, exc_msg, exc_hdl): if exc_class == UnicodeEncodeError: print "error code 1" exc_msg = "can't handle UnicodeDecodeError" elif exc_class == UnicodeDecodeError: print "error code 1" exc_msg = "can't handle UnicodeDecodeError" elif exc_class == IndexError: print "error code 2" exc_msg = "error" elif exc_class == NameError: print "error code 2" exc_msg = "error" elif exc_class == TypeError: print "error code 3" exc_msg = "error" else: print "error code 1" exc_msg = "error" exc_hdl = exc_class(exc_msg, exc_hdl) Now the problem is my code is working well when nothing happens. But if there is a wrong access such as trying to access a null pointer, the rest of the program is not working, although the try and except block is working
