In this article, we will learn Photoshop and Photoshop Elements using Photoshop tutorials for beginners. 1.1 Photoshop vs. Photoshop Elements The main differences between Photoshop and Photoshop Elements are: Photoshop is a full-fledged professional tool Photoshop Elements is a personal graphics editor Photoshop is an advanced tool, and has lots of filters,

layers and adjustment options Photoshop Elements is a fast and easy tool, it has fewer filters, and adjustment options Photoshop Elements is cheaper than Photoshop The central design element in the user interface is the layer with a stack of effects, filters, and layers. Photoshop and Photoshop Elements have some similarities. At the bottom of the screen, you will see the Layers panel, where you can create new layers and apply them to images. The layers are a way of grouping items. When you apply an effect to your layers they are all affected by it. When you apply adjustment effects, they are applied to the individual layers, and not to the entire image.

2.1 Saving files for the web

When you save a photo for the web, you don't want to save the file as a jpeg file. JPEG is a lossy file format, meaning that you have to lose a lot of information when you make a lossy conversion. Save a file for the web in the PNG format. The transparent background is a great feature of PNG. Now you don't have to worry about preserving transparency on the image, as this aspect

Numerical model of the eyelid as a function of age and fluence. The eyelid presents an interesting optical and radiobiologic problem. Preclinical animal models have been used to establish a balance between the prevention of radiation-induced eyelid injury and normal tissue complications in normal tissues, whereas clinical models are more relevant for long-term treatment of patients with eye cancer. The geometry of the human eyelid presents a variety of air-to-tissue interfaces, which are difficult to model. One method for simulating normal tissue complications is to extend the geometry of the eye and lay a buildup region over the iris. This paper investigates how the buildup region (BUF) can be used to evaluate its effect on radiation dose distributions. The BUF is taken to be the same height and shape as the human iris. However, it has a different material density and an altered optical and radiation interaction. A mathematical model of the eye is created to evaluate the photobiology. The model includes a Monte Carlo radiation transport code, an optical model, and a liquid medium. For phantoms, the distribution of dose is compared for two methods of creating the BUF. The variations in optical penetration through the buildup region are compared by placing a physical dose rate monitor in the region. The BUF is shown to have a considerable effect on the dose distribution for regionally blocked photons.

Q: How can I suppress "unrecognized selector sent to instance" when using NSNotificationCenter? I have 2 classes in 2 separate view controllers, each of which has its own -viewDidLoad method. Each view controller fires a notification when it is loaded, and that notification is fired via NSNotificationCenter. In the NotificationReceiver class, I receive the notification and set the view controller's post property to YES. That enables it to load the view. When my code calls [viewController setPost:NO], it throws an exception "unrecognized selector sent to instance 0x108e6df0". My question is: Is there a way to suppress the exception and let my view controller retain the notification and set post to NO? I could create a special method in the notification receiver class that would check if the object is the view controller, and if it is, set post to NO, but that seems like a horrible hack. I'm stumped.

A: If you get the NSNotification when the view controller is already loaded you might

Family members' experiences of witnessing distressing events in the pediatric intensive care unit: towards a shared understanding. Witnessing a distressing event for a critically ill child is an intense and intense experience. Family members have been reported to describe these events as an ordeal, a calamity, and as a worst nightmare. Our aim was to deepen our understanding of what family members describe as an ordeal and/or an ill-fated event for the child, and what they experience when witnessing such events for their child. We collected data by asking family members to write down, in their own words, what they experienced during a distressing event and how the event was for them personally. The use of data analysis methods associated with hermeneutics and phenomenology helped in reaching a shared understanding of the phenomenon. Data analysis revealed four themes that describe the family members' experience: witnessing or reacting to a distressing event for a child, suffering imposed on the family, encountering a void in knowing, and coping with an experience that is disturbing. This paper represents a first step in gaining a deeper understanding of the family members' experiences by revealing the relevance of other perspectives and methodologies in nursing research. Understanding the family's experiences is essential to holistic care.
